1 Introduction

Welcome to the official user manual for the Whop WooCommerce Checkout Plugin. This document provides comprehensive guidance on integrating Whop's premium checkout experience into your WooCommerce store. Our plugin is designed to provide enterprise-grade payment processing while maintaining a seamless, on-domain user experience.

Enterprise-grade integration icons

Whether you are a developer looking for technical architecture details or a store administrator setting up your first product, this manual covers everything you need to know to achieve a production-ready deployment.

2 Features

The Whop WooCommerce Checkout Plugin offers a robust set of features designed for modern e-commerce needs:

- **Dynamic API Key:** Easily switch between production and sandbox environments using secure, database-stored API keys.
- **Enterprise Security:** HMAC-SHA256 signature verification for all incoming webhooks ensuring that only authentic Whop notifications are processed.
- **Multilingual Support:** Automatic detection of the WooCommerce store language (English, French, Spanish, German) for the checkout interface.
- **Zero Redirect Checkout:** Customers complete their purchase within an embedded iframe on your domain, reducing cart abandonment.
- **Automated Synchronization:** Real-time order status updates in WooCommerce triggered by Whop's secure payment confirmation.
- **Unlimited Accounts:** Connect any Whop account without modifying a single line of code.

3 System Requirements

Before installing the plugin, ensure your server environment meets the following minimum requirements:

Requirement	Minimum Version / Specification
PHP	8.2 or higher
WordPress	6.0 or higher
WooCommerce	8.0 or higher
SSL/HTTPS	Required for secure checkout and webhooks
PHP Extensions	curl, json, openssl, mbstring

4 Installation

Installing the plugin is a straightforward process that follows standard WordPress best practices.

4.1 Downloading the Plugin

Download the latest version of the `whop-woocommerce-plugin.zip` file from your commercial provider or the official repository.

4.2 Uploading to WordPress

1. Log in to your WordPress Admin Dashboard.
2. Navigate to **Plugins > Add New**.
3. Click the **Upload Plugin** button at the top of the page.

Figure 1: WordPress Upload Plugin interface

4. Select the `.zip` file you downloaded and click **Install Now**.

5 Plugin Activation & Configuration

Once the installation is complete, click the **Activate Plugin** button. After activation, you will see a new menu item in your WordPress sidebar named **Whop Checkout**.

Figure 2: Navigating to Whop Checkout settings in the sidebar

Clicking this menu will take you to the main settings page where you can configure your API Key, Plan ID, and Webhook Secret. The plugin will also automatically perform a health check to ensure everything is correctly set up.

i Information

Upon activation, the plugin will attempt to register its secure webhook endpoint. Ensure your site is accessible via HTTPS for this process to succeed.

6 Creating a Whop Account

To use this plugin, you must have an active Whop account.

1. Visit <https://whop.com/dashboard> and sign up for a business account.
2. Complete your business profile and verify your identity as required by Whop's terms of service.

Figure 3: Whop Business Dashboard overview

3. Once verified, you will have access to the developer tools required for integration.

7 Creating an API Key

API keys are used to authenticate requests between your WooCommerce store and Whop.

1. Navigate to your Whop Dashboard.
2. Go to **Settings > Developer**.
3. Under **Account API Keys**, click **Create**.
4. Assign the following permissions:
 - checkout_configuration:create
 - plan:create
 - access_pass:create
5. Copy the generated key immediately and store it in a secure location.

⚠ Warning

Never share your API Key. It grants full access to your Whop business operations.

8 Creating a Product

In Whop, a “Product” represents the digital asset or access pass you are selling.

1. In the Whop Dashboard, go to **Products**.
2. Click **+ Create Product**.
3. Provide a name, description, and upload a professional image.
4. Save the product to generate its unique identifier.

9 Creating a Plan

A “Plan” defines the pricing and billing terms for your product.

1. Within your Product page, navigate to the **Plans** tab.
2. Click **Create Plan**.
3. Configure the pricing (One-time or Recurring).
4. Note the **Plan ID** (starting with plan_), as you will need this for the plugin configuration.

10 Creating a Webhook

Webhooks are essential for notifying WooCommerce when a payment is successful.

1. In Whop Dashboard, go to **Settings > Developer > Webhooks**.
2. Click **Add Endpoint**.

Figure 4: Webhook configuration in Whop Dashboard

3. Set the URL to: `https://yourdomain.com/wp-json/whop-woocommerce/v1/webhook`
4. Select the event: `payment.succeeded`.
5. Copy the **Webhook Secret** for the next step.

11 Plugin Configuration

Now, return to your WordPress Dashboard to connect the services.

1. Navigate to **WooCommerce > Whop Checkout**.

Figure 5: Plugin settings interface

2. Enter your **Whop API Key**.
3. Enter your **Production Plan ID**.
4. Enter your **Whop Webhook Secret**.
5. Click **Save Settings**.

12 Testing the Connection

After saving your settings, it is vital to verify the connection.

1. Click the **Test Whop Connection** button on the settings page.

Figure 6: Successful connection status

2. The plugin will attempt to communicate with Whop's /me endpoint.
3. A success message indicates that your API key is valid and permissions are correctly configured.

13 Connection Status

The plugin features a real-time **Health Check** dashboard. It monitors:

- API Key validity
- Webhook Secret configuration
- Plan ID accessibility
- SSL/HTTPS status
- PHP Extension availability

Tip

Always check the Health Check section after updating your site or changing hosting providers.

14 Checkout Process

The checkout flow is designed to be as frictionless as possible:

1. Customer clicks “Buy Now” on a product page.

Figure 7: WooCommerce product list with Buy Now integration

2. The plugin creates a temporary checkout session via the Whop API.
3. An embedded iframe loads the secure Whop checkout interface.

The screenshot displays the 'Complete Your Purchase' checkout page. It features a 'Payment' section with a Stripe Protected badge, an email field (johnappleseed@gmail.com), and a 'Méthode de paiement' section with a 'Carte' option selected. The card details include a masked number (1234 1234 1234 1234), MM / YY, and CVC fields. Below this is the 'Détails de facturation' section with fields for 'Nom' (France) and 'Adresse ligne 1'. Payment methods like Bancontact, Pay with Crypto, Bank transfer, and Mobile Pay are listed. An 'Acheter' button is at the bottom. To the right, an 'ORDER SUMMARY' shows 'Dulcamas Arcu' for 10,00 € and a 'Total' of 10,00 €. A 'Secure Checkout' badge lists security features: Stripe Protected, SSL Encryption, Secure Payments, and Free Shipping.

Figure 8: Real Whop Embedded Checkout in action

4. Customer enters payment details and completes the transaction.

15 Checkout Complete

After a successful payment, the customer is redirected to the order confirmation page.

Figure 8b: Real Checkout Complete page

This page confirms the payment submission and provides a “Continue Shopping” button.

16 Order Synchronization

Order synchronization happens automatically in the background:

Diagram 1: End-to-end checkout and fulfillment flow

- When a payment succeeds, Whop sends a signed webhook payload.
- The plugin verifies the signature using your Webhook Secret.
- The corresponding WooCommerce order is updated from “Pending” to “Completed”.

The screenshot shows the WooCommerce 'Orders' page. The left sidebar contains navigation links: Home, Orders, Customers, Reports, Settings, Status, Extensions, Products, Payments, Analytics, Marketing, Appearance, Plugins, Users, Tools, and Settings. The main content area displays a table of orders with columns: Order, Date, Status, Total, Actions, and Notes. The table lists 8 orders, with Order #6 being the focus. It has a status of 'Completed' and a note 'Whop Payment Verified'.

Order	Date	Status	Total	Actions	Notes
#8	May 24, 2024	Pending payment	\$49.99		
#7	May 24, 2024	Processing	\$29.99		
#6	May 23, 2024	Completed	\$99.99		Whop Payment Verified
#5	May 23, 2024	On hold	\$19.99		
#4	May 23, 2024	Pending payment	\$49.99		
#3	May 22, 2024	Cancelled	\$15.99		
#2	May 22, 2024	Processing	\$79.99		
#1	May 22, 2024	Cancelled	\$10.00		

Figure 9: WooCommerce Orders showing verified Whop payment

- A note is added to the order with the Whop Payment ID for reference.

17 Webhook Security

Security is our top priority. Every webhook request is validated using:

- **HMAC-SHA256 Signature:** Ensures the payload hasn't been tampered with.
- **Timestamp Validation:** Prevents replay attacks by ensuring the request is recent.
- **Webhook ID Tracking:** Prevents duplicate processing of the same event.

18 Automatic Language Detection

The plugin automatically adapts to your store's language settings. If your store is set to French, the checkout will automatically display in French. This works for English, Spanish, and German without any manual configuration.

i Information

No manual translation is required. The plugin detects the WordPress/WooCommerce locale and passes it directly to the Whop checkout session.

19 Refund Flow

Refunds initiated in the Whop Dashboard are currently independent of WooCommerce. We recommend manually updating the WooCommerce order status if you issue a refund via Whop to keep your accounting accurate.

20 Updating the Plugin

We regularly release updates to improve performance and security.

1. Back up your website.
2. Deactivate the old version.
3. Upload and activate the new version.
4. Your settings will be preserved automatically.

21 Migration to another Whop account

Migrating to a new Whop account is seamless:

1. Generate new credentials in the new Whop account.
2. Update the settings in **WooCommerce > Whop Checkout**.
3. The plugin will immediately begin using the new account for all future transactions.

22 Security Best Practices

- Always use HTTPS.
- Regularly rotate your API keys.
- Limit WordPress administrator access.
- Keep all plugins and themes updated.

23 Troubleshooting

If you encounter issues, follow these steps:

1. Check the **Health Check** dashboard.
2. Enable `WP_DEBUG` to see detailed error logs.
3. Verify that your Webhook URL is reachable from the public internet.
4. Ensure your Plan ID is active and public in Whop.

24 FAQ

1. **Is my data safe?** Yes, we use enterprise-grade encryption.
2. **Can I sell subscriptions?** Yes, by configuring a recurring plan in Whop.
3. **What is Whop?** Whop is a leading platform for selling digital products and access passes.
4. **Does this plugin replace the WooCommerce checkout page?** Yes, it replaces the standard checkout with an embedded Whop experience.
5. **Is my site PCI compliant with this plugin?** Yes, because payment data never touches your server; it is handled entirely by Whop/Stripe.
6. **Can I use this on multiple websites?** Yes, but each site should have its own webhook configured.
7. **How do I find my API Key?** In your Whop Dashboard under Settings > Developer.
8. **What happens if a payment fails?** The customer remains on the checkout page and can try another payment method.
9. **Does it support Apple Pay?** Yes, Whop supports Apple Pay, Google Pay, and 100+ other methods.
10. **Can I customize the checkout colors?** Yes, through the Whop Dashboard's styling settings.

11. **What is a Webhook Secret?** It is a unique string used to sign data sent from Whop to your site.
12. **How do I issue a refund?** Refunds must be issued from the Whop Dashboard.
13. **Does the plugin support variable products?** Yes, it dynamically creates inline plans for WooCommerce product variations.
14. **Is there a sandbox mode?** Yes, you can use Whop's sandbox environment for testing.
15. **Why is my checkout button not showing?** Ensure the product is "Purchasable" in WooCommerce settings.
16. **Does it work with Elementor?** Yes, it is compatible with all major page builders.
17. **Can I translate the "Buy Now" button?** Yes, using standard WordPress translation files or plugins like Loco Translate.
18. **What PHP version is required?** PHP 8.2 or higher is recommended for best performance.
19. **Is there a limit to the number of orders?** No, the plugin supports unlimited transactions.
20. **How do I see logs?** Enable WordPress debug mode or check the plugin's internal logger.
21. **Can I use this for physical products?** While primarily for digital goods, it can be adapted if shipping is handled manually.
22. **Does it support recurring payments?** Absolutely, just configure a "Renewal" plan in Whop.
23. **What is HMAC-SHA256?** A cryptographic hash function used for verifying the integrity of webhooks.
24. **How do I update the plugin?** Upload the new version via the WordPress Plugins page.
25. **Will I lose my settings after an update?** No, settings are stored in the database and persist through updates.
26. **Can I hide the Terms of Service in the checkout?** Yes, there is a setting for this in the embedded checkout configuration.
27. **Does it work with multisite?** Yes, but each sub-site needs independent configuration.
28. **How do I get a Whop account?** Sign up at whop.com.
29. **Is there a setup fee?** Whop has its own pricing structure; the plugin itself is a one-time commercial purchase.
30. **What if my server is behind a firewall?** You must allow incoming POST requests from Whop's IP ranges to your webhook URL.
31. **Can I use a custom domain for checkout?** Yes, Whop supports custom domains for business accounts.
32. **Does it support discounts?** Yes, you can use Whop promo codes directly in the checkout.
33. **What is an Access Pass?** A digital key that grants users access to your content or community.
34. **How long does order sync take?** Usually less than 2 seconds after the payment is completed.
35. **What if I change my store URL?** You must update your Webhook URL in the Whop Dashboard.
36. **Is the plugin open source?** It is licensed under GPLv2 or later.
37. **Can I add custom fields to the checkout?** Yes, via the Whop Dashboard's plan settings.
38. **Does it support crypto payments?** Yes, Whop has extensive support for various cryptocurrencies.
39. **How do I contact support?** Visit our official support portal mentioned in the Appendix.
40. **What is the 'Buy Now' flow?** A streamlined process that skips the cart and goes straight to checkout.
41. **Can I disable standard WooCommerce payments?** Yes, the plugin provides an option to disable other gateways.
42. **Is it compatible with WooCommerce 8.9?** Yes, it is tested with the latest versions of WooCommerce.
43. **What is a Plan ID?** A unique string like `plan_abc123` that identifies your pricing.

25 Administrator Guide

Administrators can monitor all Whop transactions via the standard WooCommerce Orders page. Each order will contain metadata linking it to the Whop checkout session.

26 Architecture Overview

The plugin uses a service-oriented architecture with a dependency injection container. This ensures high reliability and easy maintenance.

Diagram 2: Internal plugin architecture and service layers

27 Production Checklist

- ☐ HTTPS is active.
- ☐ API Key is valid.
- ☐ Webhook is configured and tested.
- ☐ Plan ID is correct.

- [] Test purchase completed successfully.

28 Glossary

- **API Key:** A secure token for authentication.
- **Webhook:** An automated notification from one server to another.
- **Plan ID:** A unique identifier for a pricing structure.

29 Appendix

Contains technical specifications and filter hooks for developers.

30 Support

For further assistance, please contact our official support channel or visit our documentation portal.

31 Enterprise Features and Scalability

31.1 High Volume Transaction Support

The plugin is engineered to handle thousands of concurrent checkout sessions. By leveraging WordPress transients for temporary session data, we minimize database load during peak traffic events, such as product launches or holiday sales.

31.2 Failover and Retry Logic

In the event of a network hiccup between your server and Whop, the plugin implements an exponential backoff retry policy. This ensures that checkout sessions are created reliably even under sub-optimal network conditions.

31.3 Multi-currency Support

Whop's checkout interface automatically presents prices in the customer's local currency if enabled in your Whop Dashboard. The plugin synchronizes these values back to WooCommerce using the base currency of your store to ensure accounting consistency.

32 Developer Reference

32.1 Filter Hooks

Developers can extend the plugin's behavior using the following WordPress filters:

- `whop_woocommerce_checkout_payload`: Modify the data sent to Whop before session creation.
- `whop_woocommerce_metadata`: Add custom key-value pairs to the checkout metadata.
- `whop_woocommerce_return_url`: Dynamically change where customers are sent after payment.

32.2 Action Hooks

- `whop_woocommerce_payment_succeeded`: Trigger custom logic immediately after a verified payment.
- `whop_woocommerce_order_completed`: Runs after the WooCommerce order status has been updated.

33 Security Compliance

33.1 Data Privacy (GDPR/CCPA)

The plugin is fully compliant with modern data privacy regulations. Customer payment information is processed offsite, and the plugin only stores the minimum necessary metadata to link Whop transactions to WooCommerce orders.

33.2 Signature Verification

All incoming webhooks must pass a strict HMAC-SHA256 signature check. This prevents “man-in-the-middle” attacks and ensures that only legitimate payment notifications can update your order statuses.

34 Advanced Troubleshooting

34.1 Webhook Debugging

If orders are not updating to “Completed”, check the following:

1. Is your site behind a maintenance mode plugin?
2. Does your server allow POST requests to the `/wp-json/` endpoint?
3. Is the Webhook Secret in WordPress an exact match for the one in Whop?

34.2 Log Analysis

The plugin logs all critical events to the standard WordPress `debug.log` file when `WP_DEBUG` is enabled. Look for entries prefixed with `[Whop Checkout]` to trace the lifecycle of a specific transaction.

35 Performance Optimization

35.1 Asset Loading

The plugin only loads its CSS and JavaScript on the checkout and product pages. This ensures that your site’s overall load time remains fast and optimized for SEO.

35.2 Database Footprint

We use standard WordPress metadata and transients to store information. No custom database tables are created, making the plugin easy to uninstall or migrate without leaving behind “database bloat”.

36 Detailed Process Flow

36.1 Initialization Phase

When a user visits a product page, the plugin checks if the product is eligible for Whop checkout. It then renders the “Buy Now” button which is protected by a secure WordPress nonce.

36.2 Session Creation Phase

Upon clicking the button, the server-side CheckoutService initiates a request to Whop. This request includes:

- Product metadata
- Customer information (if logged in)
- Dynamic price calculation based on WooCommerce settings

36.3 Payment Execution Phase

The customer interacts with the Whop iframe. All sensitive data (Credit Card numbers, etc.) is sent directly to Stripe/Whop. Your server never sees or stores this data, ensuring maximum security.

36.4 Fulfillment Phase

Once the payment is verified, Whop's server-to-server communication (Webhook) triggers the OrderHandler on your WordPress site. This service:

- Validates the request authenticity.
- Matches the payment to the WooCommerce order.
- Updates the order status and sends the standard WooCommerce "Order Complete" email to the customer.
